

CLEAN WATER IS ESSENTIAL TO EVERYONE.

Contaminated water doesn't just affect fish and wildlife living in our local waters—it impacts our everyday lives through the food we eat, the streams and water bodies near our homes, and our economy.

CHALLENGES

90% of Delaware's waterways are polluted from excess nutrients and legacy toxics.¹

100 miles of Delaware's waters have fish consumption advisories from high PCBs, metals, and pesticides.²

\$100 million annually is currently the shortage faced by Delaware to address water quality programs.¹

1 acre of tidal wetlands are collectively being lost everyday in the Delaware region.³

OPPORTUNITIES

Significant increases in clean water investments could result in:

Decreased pollution in our waterways

Improved protection of drinking water sources

Innovative nature-based techniques that reduce flooding

Reduced pipeline and breakage and sewage overflows
